Design Concept

Tropical Luxury Resort Bathroom

Growing up in a tropical country, often times my designs were inspired by biophilic components surrounding me. As a child who travels a lot, I tend to be fascinated by the coziness of resort bathrooms, hence, I wanted the bathroom design to bring the outdoors in, featuring a mixture of beach and rainforest elements look and feel. As the main concept is maintaining hygiene and eco-friendliness, the design focuses on using natural, organic materials and sustainable design solutions. Beige coloured quartz slabs are used to represent sand, brown from the wood symbolising the warm temperature of beaches and contrasting greenery presenting rainforests to complement. With the nature-inspired compositions, the design hopes to contribute in creating comfort, sustainable yet maintaining a luxury resort experience for travelling guests.

Design: Floor Plan and Elevations

Separated toilet and shower areas not only offers privacy to the users, it also avoids contamination from toilet flushing, therefore reducing the spread of germs and bacteria.

In terms of design, it avoids the toilet to be the focal point, allowing the eye to be drawn into the tub and wash basin area. Natural lighting from full-sized windows are enhanced to ensure minimum use of artificial lights.

Design Visuals: Full Bathroom

The design targets guests coming for leisure trips, more specifically couples or families with children. Most of the time, guests return to the place of accommodation exhausted, therefore, a neutral colour palette consisting of woody brown, ivory and grey with hints of green from vegetations is used. When blended together with warm-coloured lighting, it creates a tropical, fresh ambience and a cozy atmosphere for the users to relax in. Having separated toilet and shower areas allows the user to do their business while their partner uses the rest of the bathroom.

Design Visuals: Toilet Area

Focusing on hygiene and cleanliness, the toilet room is separated which may prevent contamination from flushing as well as privacy. With the Double Vortex water closet from the Acacia Evolution catalogue allowing half flush, water is also saved, contributing to the eco-friendly solution of the bathroom. In addition to this, with the entire interior of the bowl effectively cleaned, the ComfortClean solution offering maximum hygiene, hence offering guests a worry-free stay.

Design Visuals: Basin Area

With hygiene and health as the main concern, the choice of touch-less products and antibacterial technologies help maintain the cleanliness of the bathroom. The design also focuses on sustainability, therefore with sensor faucets, not only it reduces the spread of germs, the use of water also becomes more efficient compared to manual use.

Design Visuals: Optional Images

At night, the bathroom relies heavily on artificial lighting, in which a warm coloured lighting is used to create a comfortable, relaxing atmosphere

Specifications: Colors, Materials and Finishes

Materials such as quartz and soapstone for walls, floorings and other surfaces are chosen for their high resistance against bacteria and stains due to their non-porous characteristic. Greenery is also added to the space to purify air, absorb moisture as well as for aesthetics.
