Design Concept

Sustainable Urbanisation

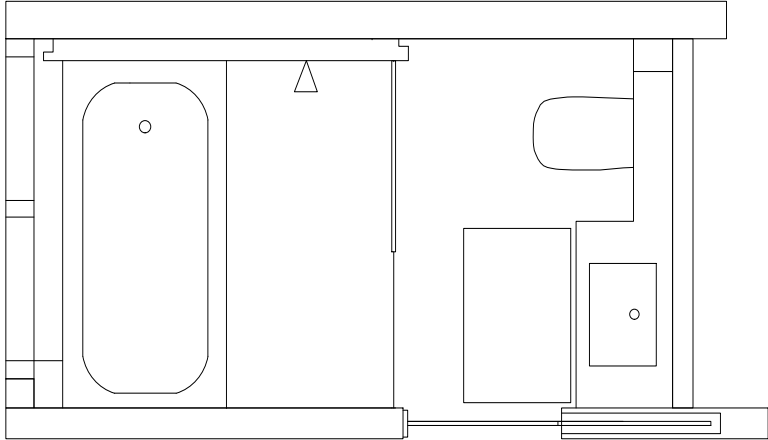

Urbanisation and sustainability are two distinct concepts with distinct meanings. These two processes are interconnected that results in the phrase "urban sustainability" or "sustainable urbanisation." With sustainable living, that is what drives towards urbanisation. My vision for the design of the bathroom is to have tranquil, zen and eco-friendly bathroom. With simple LED lights, a different atmosphere can be created and a huge amount of energy can be conserved. Another example is through my choice of material. By having some woody tones in the bathroom could allow my bathroom to look tranquil and zen. With the use of material that could last longer, the homeowner would not need to replace the material as frequent. With these, we could work towards a more sustainable and urbanised environment. I personally think that sustainability in interior design is an important factor to an urbanised environment.
